

Graph Theory

Representation, Storage Alternatives, Traversing, Searching, Operations, Graph Drawing, Project

A graph is one of the most versatile structures in mathematics with widespread research & practical uses. We see use of graph concepts in areas ranging from the knowledge graph, the social graph and in organization-specific graphs (e.g. Microsoft Graph). Devs are used to graph terms such as the “object graph” or the “call graph”. Graph databases are becoming very popular. Anywhere you see the work “network” in industry there is a mathematical graph lurking underneath. Because of its popularity, we even see use of the “graph” term where it shouldn’t be – e.g. GraphQL (which is neither graph-based, nor indeed, a query language).

This course covers all aspects of graph theory, from simple representation, to traversal and search, to transformations, to display. Starting with simple edges and vertices (with storage as either a matrix or a linked list [preferred for sparsely populated graphs]), we investigate how to build, transform and present graphs.

We explore how to efficiently handle large graphs with a keen interest in high performance. This course also covers graph drawing (a surprising complex topic in its own right). We conclude with a project to build a graph engine.

Contents of One-Day Training Course	
<p>Target Audience This course is aimed at mathematicians and developers who wish to become familiar with the theoretical and practical usage of graphs in a variety of scenarios.</p> <p>Prerequisites Attendees need a good foundation in mathematics and programming, as this course will be covering graph-related ideas from both disciplines.</p> <p>Attendees need to be familiar with one programming language. Any will do, as in the hands-on labs they will be developing a graph library in that language from first principles.</p>	<div style="display: flex; justify-content: space-between;"> <div style="width: 48%;"> <p>Overview of Graph Theory</p> <p>Part of discrete mathematics No “top” or root Overview of graph concepts Vertices and edges</p> <p>Introduction to Graphs</p> <p>$G = (V, E)$ where V is a node set and E is an edge set</p> <p>Simple graph Multi-graph Common operations on graphs Basic terminology Directed (digraphs) vs. undirected graphs</p> <p>Traversing A Graph</p> <p>The visitor pattern Ensuring each node is visited Weighted graph (e.g. assign a “cost” to each edge, to influence selected path)</p> <p>Searching A Graph</p> <p>Breadth-first search Depth-first search Dealing with cycles</p> <p>Graph Operations</p> <p>Graph composition: merge points to be based on identity of edges Subsumption Node selection Edge contraction</p> <p>Types of Graphs</p> <p>Connected graph Bipartite graph Complete graph Regular graph</p> </div> <div style="width: 48%;"> <p>Graph Properties</p> <p>Shortest path Minimum spanning trees Traveling salesman</p> <p>A Tree As A Kind Of Graph</p> <p>Every tree is a graph, but not reverse Binary search trees Subtrees</p> <p>Graph As Network Flow</p> <p>Networks appear throughout engineering, science, business and daily life – how to best represent as graphs Max flow / min cut theorem Interacting with networks as graphs</p> <p>Graph Data Structures</p> <p>Adjacency matrix vs. adjacency list How to optimize for large graphs Indexing Improving storage on hard disk</p> <p>Graph Databases</p> <p>Review of how graphs are handled by a graph database Querying possibilities Sample usage</p> <p>Graph Drawing</p> <p>How to automate placing graph constructs on a planar surface The crossing number How to improve automated layout</p> <p>Project</p> <p>Creating a custom graph engine to store and interact with large-scale graphs efficiently</p> </div> </div>
